

VERSION 5.0  
NOVEMBER 6, 2017

# DDP PRO

## INSTALLATION AND USER GUIDE

PRESENTED BY: WOJOSCRIPTS  
WOJOSCRIPTS.COM

Thank you for your purchase! If you have any questions that you feel should have been in this document, please log in using the account used to purchase the file and email via my user profile page contact form there. Thanks!

For questions on basic HTML, JavaScript or CSS editing - please give your question a quick Google or visit W3Schools as theme issues get top priority.

---

## REQUIREMENTS

Please ensure your web host meets the application requirements. The lists of requirements are:

### Web Server Requirements

- Operating System: Linux, Unix, or Windows
- Web Server: Apache
- Scripting Language: PHP 7.0 or above
- Apache mod\_rewrite
- Multibyte string
- INTL extension
- PHP GD library
- Database: MySQL 5.5 or above (PDO driver enabled)

If you're unsure whether your server meets these requirements, simply ask your hosting provider.

---

## INSTALL

Unzip the DDP package into your local hard drive. If you don't have WinZip, you can download it for free from <http://winzip.com>.

Using an FTP program (such as Filezilla, which is free, or a commercial package such as CuteFTP), login to your web server and copy the DDP files across into your base website directory. This directory is commonly called 'public\_html', 'html', 'www' or 'httpdocs'. If you're not sure what it is, your webhost provider will be able to tell you.

## WEB SERVER REQUIREMENTS

DDP requires the following files/directories to have 'write' permissions set. If you're running on a Linux or UNIX web host, you can use your FTP program and use the 'CHMOD' ('Change Mode') function to grant writes permissions.

If your host is running Windows, you will need to contact your hosting provider about setting up write permissions on these files/folders.

Folders, CHMOD these to 755:

- /uploads/
- view/admin/cache /
- view/front/themes/master/cache/

**NOTE: ALTHOUGH IT SAYS 755, SOME WEBHOSTS MAY REQUIRE 775 OR 777 INSTEAD.**

## MYSQL DATABASE

DDP makes use of a MySQL database to store your data. This database must be created before you run the DDP installation wizard. Your MySQL user account should also have full grant access to that database.

You will need the database connection details during the setup wizard.

Setting up your database may differ with your webhost and what software they use for your web hosting control panel. If you don't know how ask your hosting provider.

## SETUP WIZARD

DDP includes a simple 3 step installation process. To start the setup wizard, navigate to the directory that you uploaded CMS PRO, for example: <http://www.example.com/>.

The DDP setup wizard will appear. Follow simple on screen instructions.

---

## WHATS NEW?

V4.0 is complete and full rewrite. Every single file is modified in order to support latest php, mysql jQuery etc...

Due to those massive changes upgrade at this time is not possible for few reasons:

1. Passwords are now being hashed in users table, vs sha1() older method. This adds security to user accounts, and it is impossible to decrypt passwords even if someone can gain access to your database.
2. Brand new framework is introduced (virtual routing) something similar to MVC pattern, except model is not being used. Only controller and view.
3. New debugging console, which is a must for any developer trying to troubleshoot errors in PHP environment. To enable console, open up /lib/config.ini.php file and set DEBUG to true.
4. New framework is faster more secure, and uses lot less memory and resources.

## NEW FEATURES

- New front and backend design.
- Fully responsive (renders perfectly on any device).
- New gateways (Ideal) Single payments.
- Stripe (recurring payment added).
- Detailed sales statistics per product/membership and per user.
- User history (previously purchased memberships).
- Product history (previously purchased products).
- User permissions assignable admin permissions.
- Custom fields (Ability to sell, virtually any type of digital product)
- Membership VIP access
- Multiple product types (Regular, VIP access CD Keys, and affiliate)
- Trash System
- Multiple files per product

---

## HELP

### File Directory Configuration.

In order to secure, and protect your file files, you must create a secure folder.

This is a folder where your files will be stored. You should store your downloads in publicly non-accessible directory. E.g.: if path to your public directory is: /home/yourusername/public\_html/

You should create directory in: /home/yourusername/filedirectory/ and enter full path in DDP Configuration File Directory field. All paths must start and end with backslash/ if linux/unix server is used.

On windows based servers path starts with drive letter such as d:\server\rooth\www\

To find out your current root path, go to System Information page in DDP admin panel, and look for Root Path entry

---

## CACHE FOLDER

When modifying css files do not change anything in **/view/admin/cache/** or **/view/front/themes/master/cache/**

Instead modify individual css files located in **/view/admin/css/** or **/view/front/themes/master/css/**

Cached file **master\_main.css** will be automatically updated.

---

## SETTING UP CRONJOB

Make sure to set up a cronjob on /cron/cron.php. Run it every day using (wGet) just before midnight. Cron job will automatically remove expired memberships Stripe recurring, email notifications etc...

If you don't know how to use CronJob, please contact your hosting company.

---

## SOURCES & CREDITS

Images included in preview are for demonstration purposes only. Some photos can be purchased separately. (If needed, particular links can be given at your email request).

In downloaded product folder placeholders might be used instead of real stock images.

Thank you for purchasing this script!
